

# Locating Elements & Navigating Dynamic Web Pages

---

**Pratheerth Padman**  
FREELANCE DATA SCIENTIST

# Module Overview

**What is an element? What are dynamic elements?**

**Methods to locate elements**

**Demo : Locating elements in a webpage**

**- Part 1**

**Demo : Locating elements in a webpage**

**- Part 2**

**Demo: Navigating a webpage**

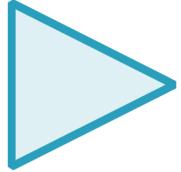

# Introduction to Elements

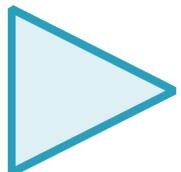

---

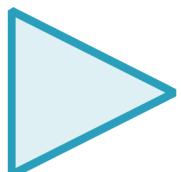

# What Are Elements? Why Locate Them?

**Everything you see on a page is an element**

**Field, link, text, image etc.**

**To interact with webpage, first locate the necessary element**

# Dynamic Web Elements

**Elements whose ID, name, class or css-attributes are not fixed**

**Change whenever page is reloaded**

**Session or database driven change**

**Ubiquitous in modern day web applications**

# Methods to Locate Elements

---

# Locating Elements - 1

**Locating element by Name**

**Locating element by ID**

**Locating element by Link Text**

**Locating element by Partial  
Link Text**

# Locating Elements - 2

**Locating element by CSS Selector**

**Locating element by Tagname**

**Locating element by Classname**

**Locating element by XPath**

# XPath

**XPath - language used for locating nodes in an XML document**

**Goes beyond locating by id, attributes**

**Used when there isn't a suitable id or name attribute for target element**

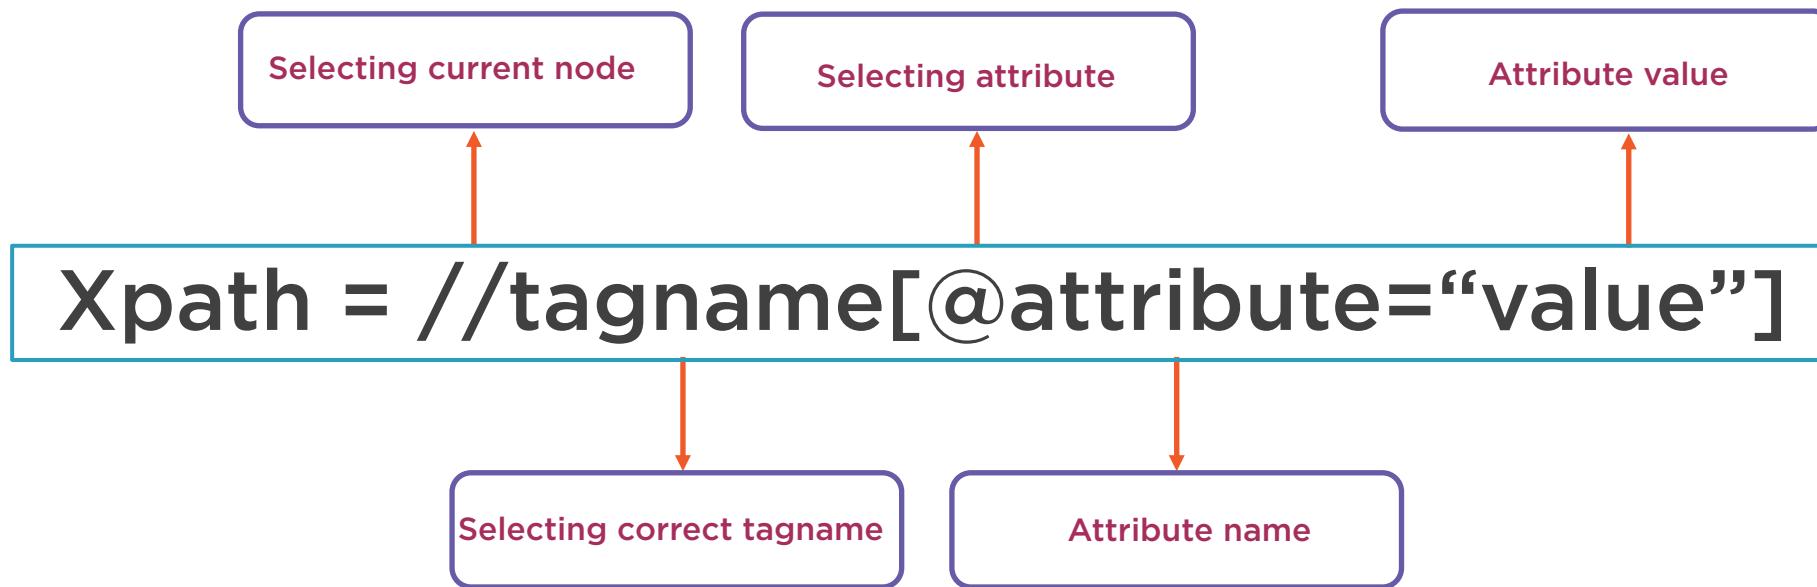

**Absolute XPath (not advised)**

**Relative XPath**

**Can use attributes other than name and id to specify elements**

# XPath – Basic Format

# Element Locating Techniques

## Find Element

Returns first element if there are multiple web elements found with the same locator

Throws exception “NoSuchElementException” if there are no elements matching the locator strategy

Not Applicable

## Find Elements

Returns a list of web elements

Returns an empty list if there are no web elements matching the locator strategy

Each web element is indexed starting from 0, like an array.
